

Hypernetworks and Design for Non-Equilibrium Global Systems Science

Jeffrey Johnson and Yangxue Xiang

The Open University, Milton Keynes, UK

GSDP & NESS European Projects

Alibaba Business School, Hangzhou Normal University, China

Hypernetworks

Networks can represent relationships between pairs, $\langle x, y \rangle$

e.g. x trades with y

Hypernetworks

Networks can represent relationships between pairs, $\langle x, y \rangle$

e.g. x trades with y

What about relationships between three things, $\langle x, y, z \rangle$

e.g. x , y and z form an oligopoly.

Hypernetworks

Networks can represent relationships between pairs, $\langle x, y \rangle$

e.g. x trades with y

What about relationships between three things, $\langle x, y, z \rangle$

e.g. x , y and z form an oligopoly. Or a relation between 4 things

Hypernetworks

Networks can represent relationships between pairs, $\langle x, y \rangle$

e.g. x trades with y

Or any number of things ...

(a) line 1-dimensional

(b) triangle 2-dimensional

(c) tetrahedron 3-dimensional

(d) pentahedron 4-dimensional

The generalisation of an edge in a network is a *simplex*
 Simplices can represent n -ary relation between n vertices

A 1-simplex $\langle a, b \rangle$ has 2 vertices

A 2-simplex $\langle a, b, c \rangle$ has 3 vertices

A 3-simplex $\langle a, b, c, d \rangle$ has 4 vertices

A p -simplex $\langle v_0, v_1, \dots, v_p \rangle$ has $p+1$ vertices

The generalisation of an edge in a network is a *simplex*

A p -dimensional simplex has $p+1$ vertices

From Networks to Hypernetworks

Binary relations & links are essential

But we also need n-ary relations, $n > 2$

From Networks to Hypernetworks

Binary relations & links are essential

But we also need n-ary relations, $n > 2$

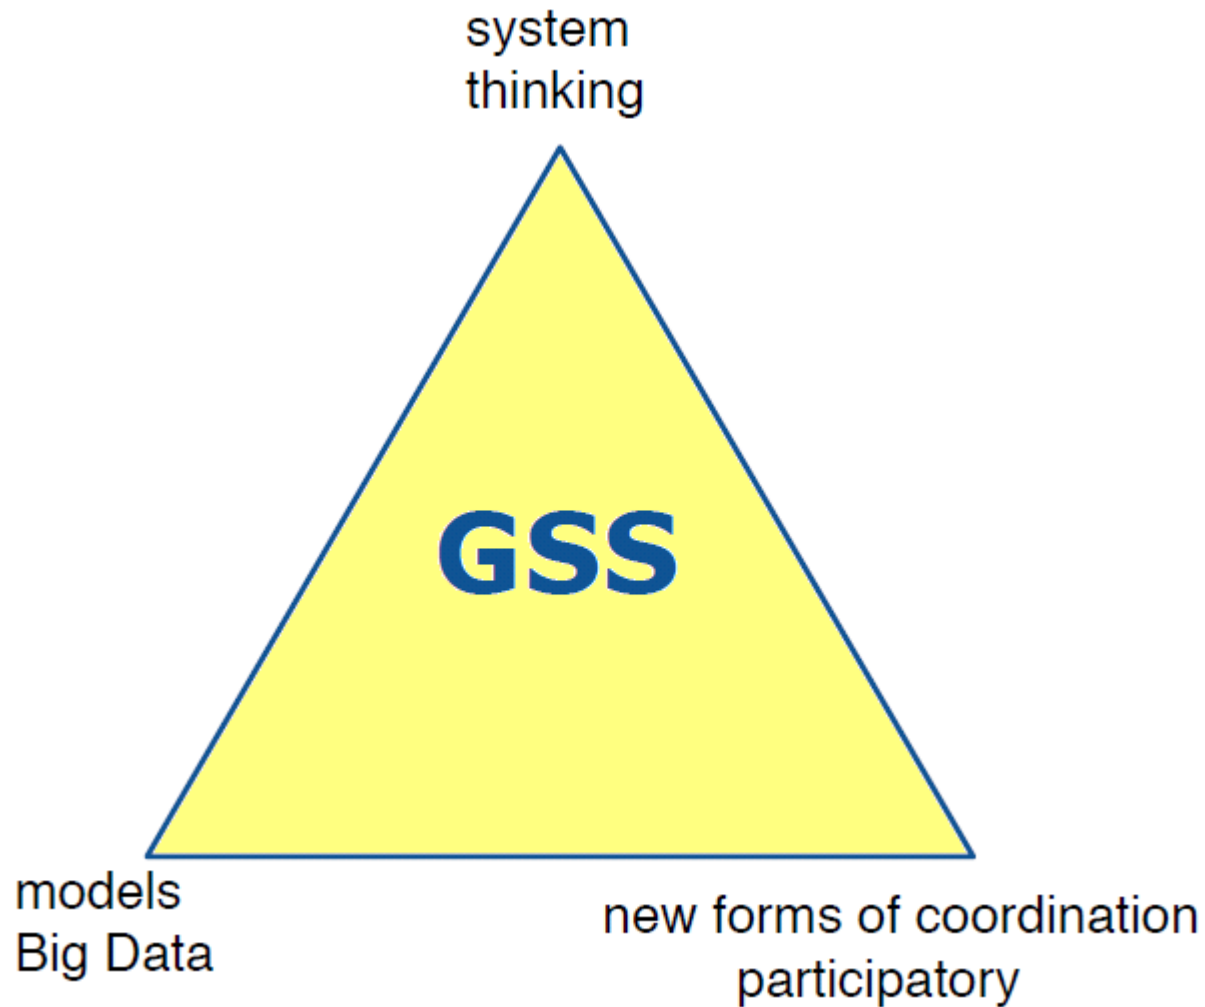

This is a 3-ary relation

**Remove any vertex
and there cannot be
this transaction**

**The transaction is a
'whole'**

Global Systems Science as a 2-simplex (source: Ralph Dum)

From Networks to Hypernetworks

Gestalt Psychologist Katz:

Vanilla Ice Cream \neq cold + yellow + soft + sweet + vanilla

it is a **Gestalt** – experienced as a whole

⟨ cold, yellow, soft, sweet, vanilla ⟩

From Networks to Hypernetworks

$$\langle \text{Cold, Sweet, Vanilla, Soft, Yellow} \rangle \neq \langle \text{Cold} \rangle + \langle \text{Sweet} \rangle + \langle \text{Vanilla} \rangle + \langle \text{Soft} \rangle + \langle \text{Yellow} \rangle$$

(a) a set of vertices

(b) a polyhedron

(c) a clique

set of vertices \neq simplex \neq clique

$\langle \text{cold, yellow, soft, sweet, vanilla} \rangle$

Simplices represent wholes

... remove a vertex and the whole ceases to exist.

(a) Remove a vertex and the cyclist simplex ceases to exist

(b) Remove a vertex and the perfect gin and tonic ceases to exist

Fig. 4.8 Remove a vertex and the simplex ceases to exist.

Richard Gregory's café wall illusion

$\langle s_0, s_1, \dots, s_{95} R_{\text{offset}} \rangle$

illusion: Squares narrow horizontally

$\langle s_0, s_1, \dots, s_{95} R_{\text{aligned}} \rangle$

No illusion

A hypernetwork is a set of relational simplices

Hypernetworks augment and are consistent with all other network and hypergraph approaches to systems modelling:

Relational Simplices and Multilevel Systems

5.1 Systems of Systems of Systems

Most systems are characterised by having many subsystems and levels of description. They are made up of inextricably entangled multilevel social and physical subsystems with intra-level and inter-level bottom-up and top-top-down dynamics. They are *systems of systems*. In fact they are systems of systems of systems, and more generally multiple levels of systems of systems.

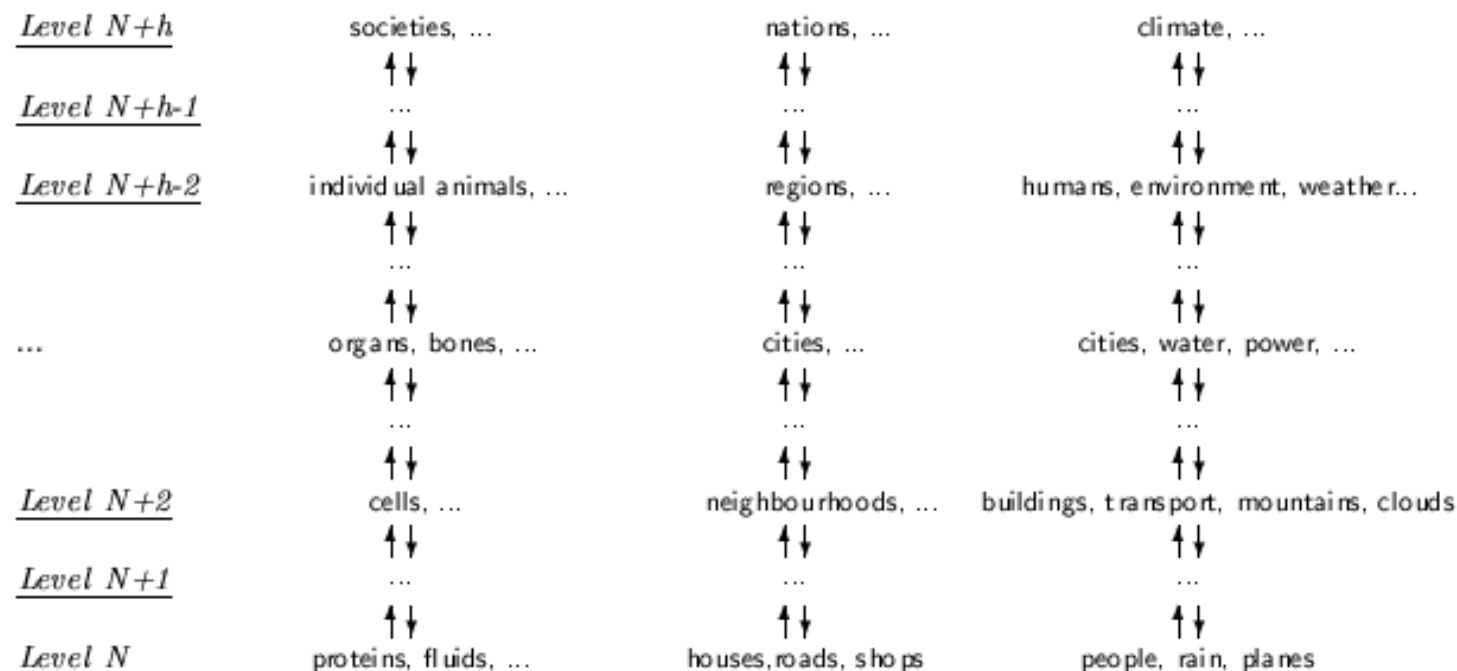

Fig. 5.1 Systems of systems of systems of systems ...

Multilevel Systems

Can highly entangled multilevel systems separated into well-defined levels ?

Multilevel Systems

Level N_{max}

The System

Level N_{min}

← What
← are
← the
← intermediate
← words?

nurses, patients, doctors, surgeons, administrators, visitors, ...
bandages, scissors, pills, beds, chairs, charts, scalpels, ...
needles, trolleys, lights, windows, doors, floors, ceilings, ...
wards, offices, operating theatres, corridors, ...

Hierarchical
Soup

The Intermediate Word Problem

Multilevel Systems

Fig. 5.4 Intermediate Words for a Hospital System

Formation of simplices \Rightarrow hierarchical structure

e.g. take a set of 3 blocks

Formation of simplices \Rightarrow hierarchical structure

e.g. take a set of 3 blocks
assembled by a 3-ary
relation \mathcal{R}

Formation of simplices \Rightarrow hierarchical structure

e.g. take a set of 3 blocks
assembled by a 3-ary
relation \mathcal{R}

The structure has an
emergent property

Formation of simplices \Rightarrow hierarchical structure

n-ary
relation
assembles
elements
into named
structures at
a higher
level

Level N+1

Level N

Formation of simplices \Rightarrow hierarchical structure

relation
assembles
elements
into named
structures at
a higher
level

AND and OR aggregations in multilevel systems

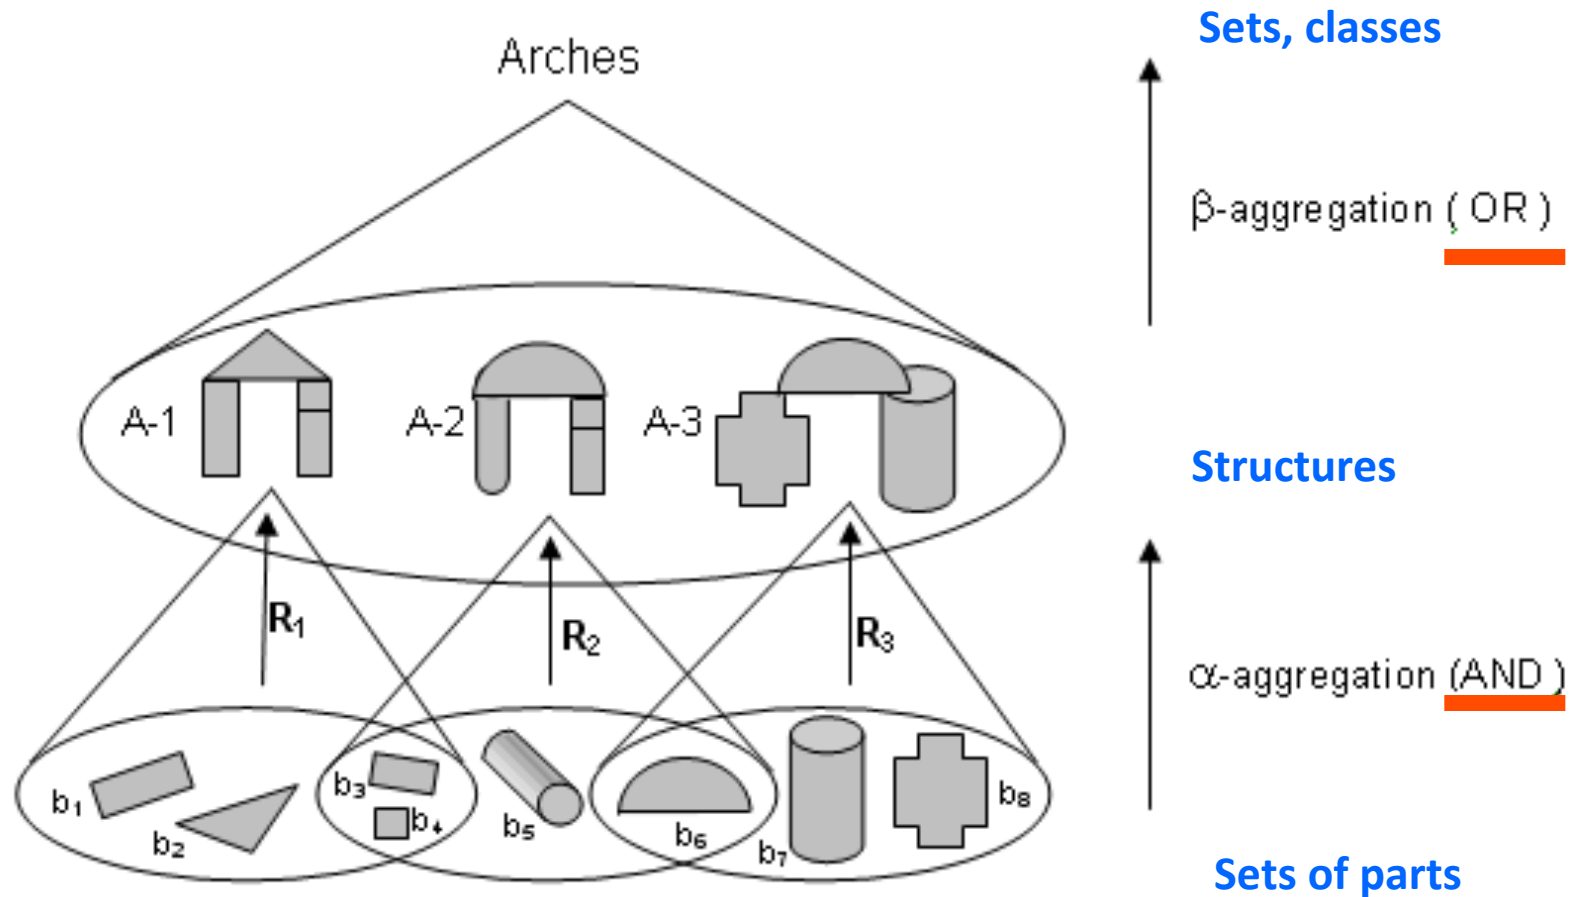

Figure 8. Two different types of multilevel aggregation

Conventional classification trees don't have alpha aggregations

Mereology

Parts and wholes go back millennia to Plato and Aristotle.

mereology was coined in 1927 by Stanislaw Lesniewski

A *mereological system* is defined to be composed of objects, X , and a binary relation called **parthood**, 'x is a part of y'.

Winston, Chaffin and Herrmann gave six types of meronymic relations:

1. component integral object (pedal-bike),
2. member-collection (ship-fleet),
3. portion-mass (slice-pie),
4. stuff-object (steel-car),
5. feature-activity (paying-shopping), and
6. place-area (Everglades-Florida).

Mereology: e.g. component – integral object

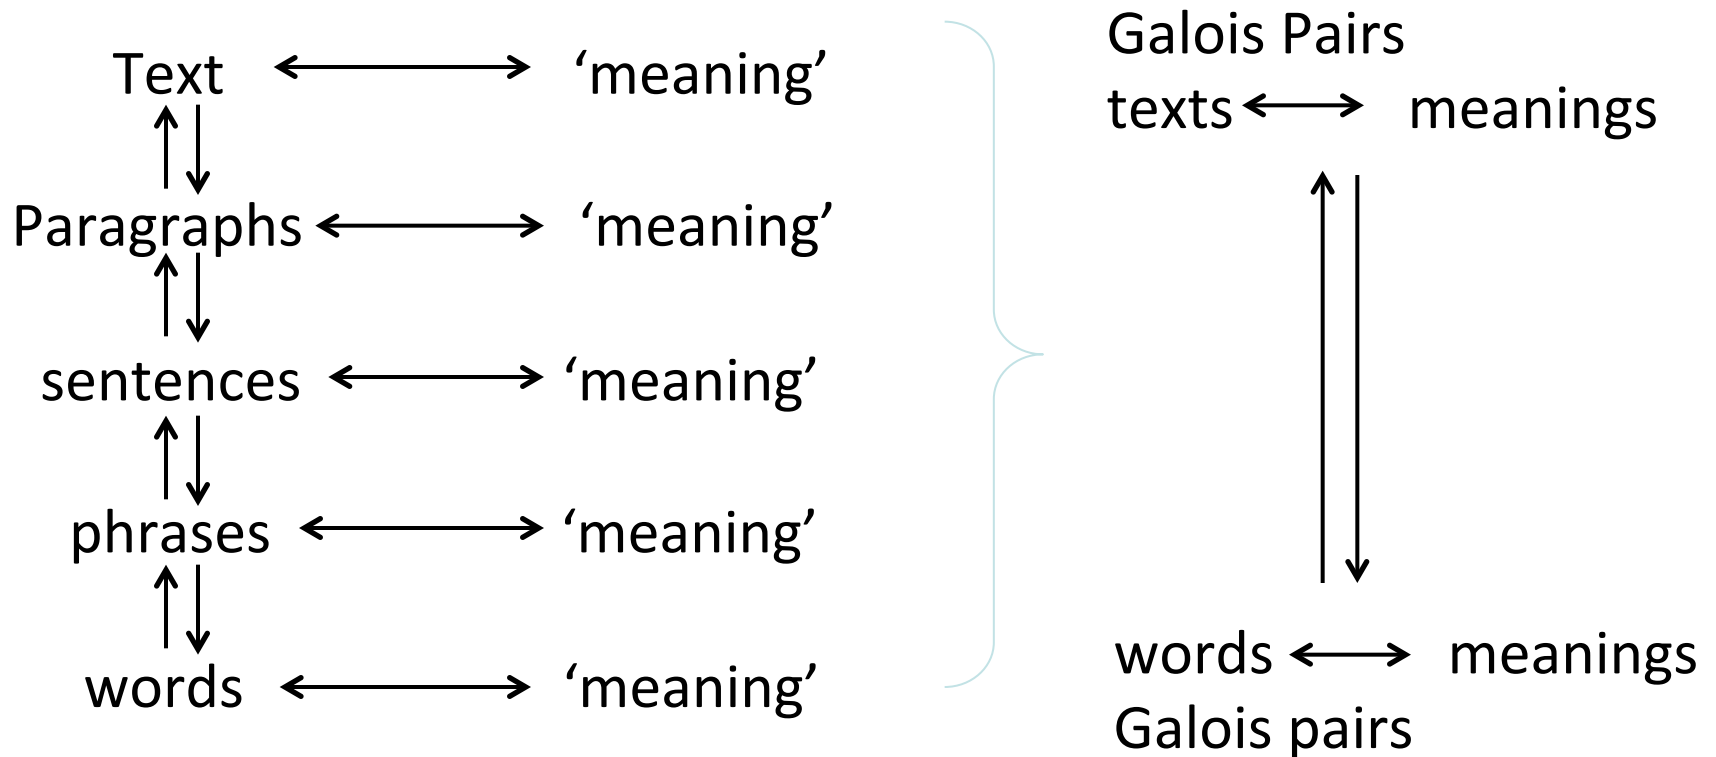

Fig. 1.21 The handle is part of the cup

Applications

Digital texts are multilevel systems of hypersimplices

Applies to the analysis of policy narrative in Big Data – but may need many relations

Multilevel patterns of numbers on the structure

Level $N+2$

Level N

Level N

The simplices form a **backcloth** for the more dynamic traffic (numbers)

... but there are also backcloth dynamics as relational simplices are formed.

Dynamics on the hypernetwork backcloth

System dynamics as traffic on a fixed multilevel backcloth

e.g. the dynamics of greenhouse gas reduction

Figure 2. discrete micro-dynamic, semi-continuous meso-dynamics and continuous macro-dynamic

3. Policy

Policy is designing the future

Policy as designing the future is *entangled* with complexity science and design

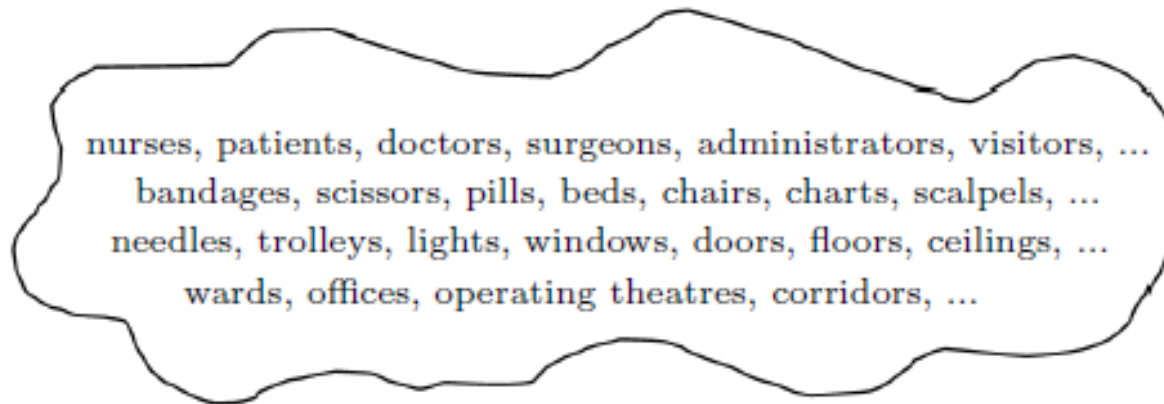

Policy is designing the future

Level N_{max}

The System

Level N_{min}

← What
← are
← the
← intermediate
← words?

Hierarchical
Soup

Design is an Intermediate Word Problem

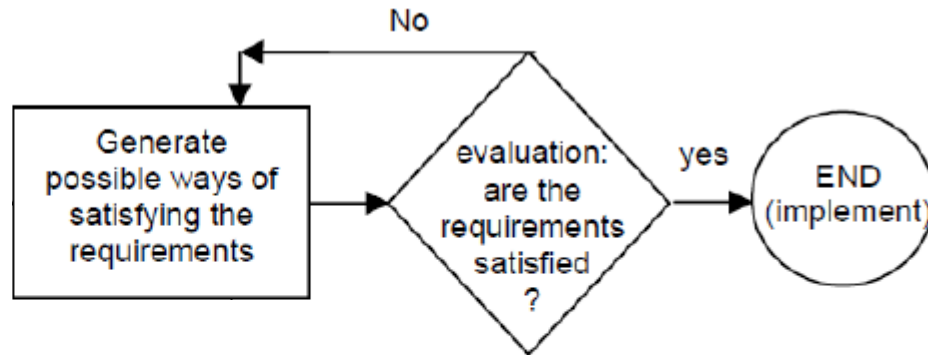

What are the intermediate structures ?

What shall we call them ?

Policy is designing the future

Innovation involves creating artificial systems

Creating artificial systems involves **Design**

The simplified generate-evaluate model of the design process

Policy is designing the future

Innovation involves creating artificial systems

Creating artificial systems involves **Design**

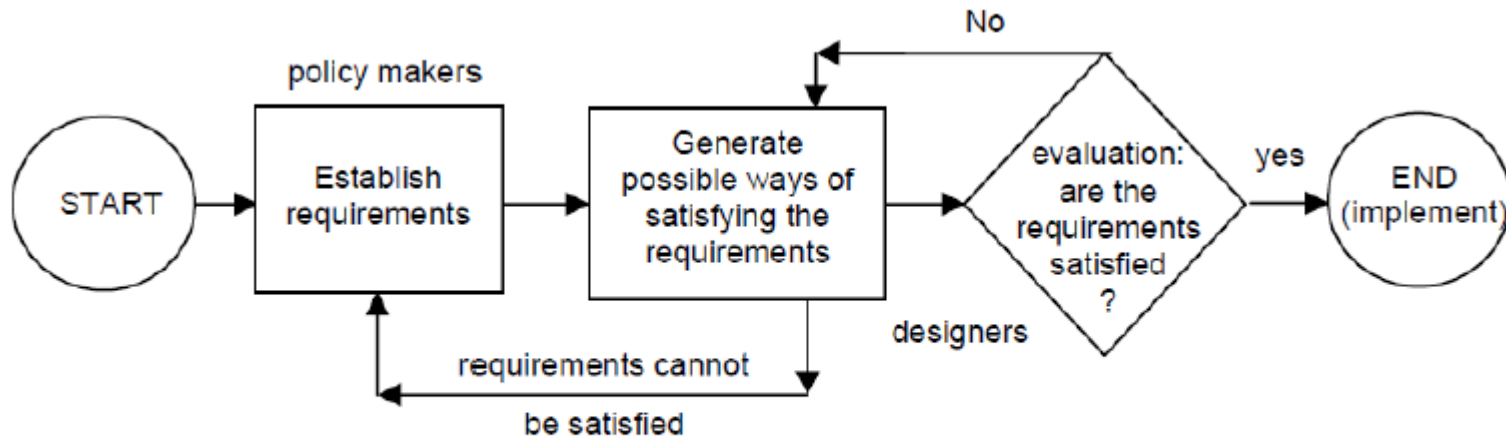

Fig. 1 The simplified requirements-generate-evaluate model of the design process

Design a co-evolution between what you think you want & what you think you can have

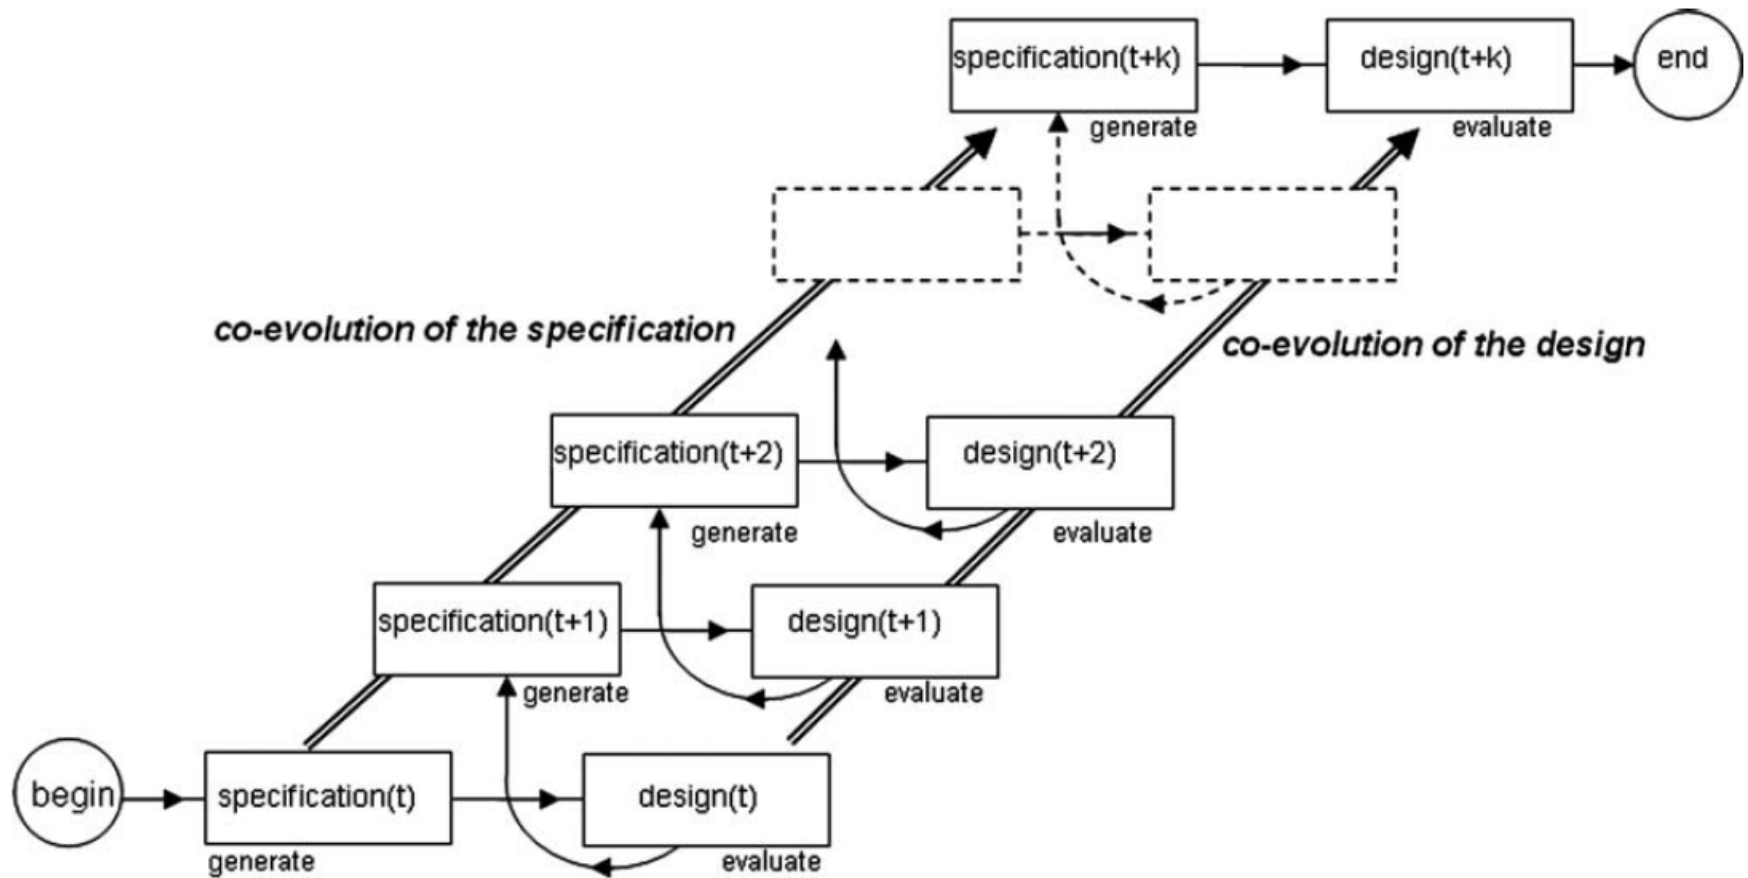

Fig 2. The co-evolution between specification and design through a generate–evaluate spiral.

Design is an iterative *process* – it takes time

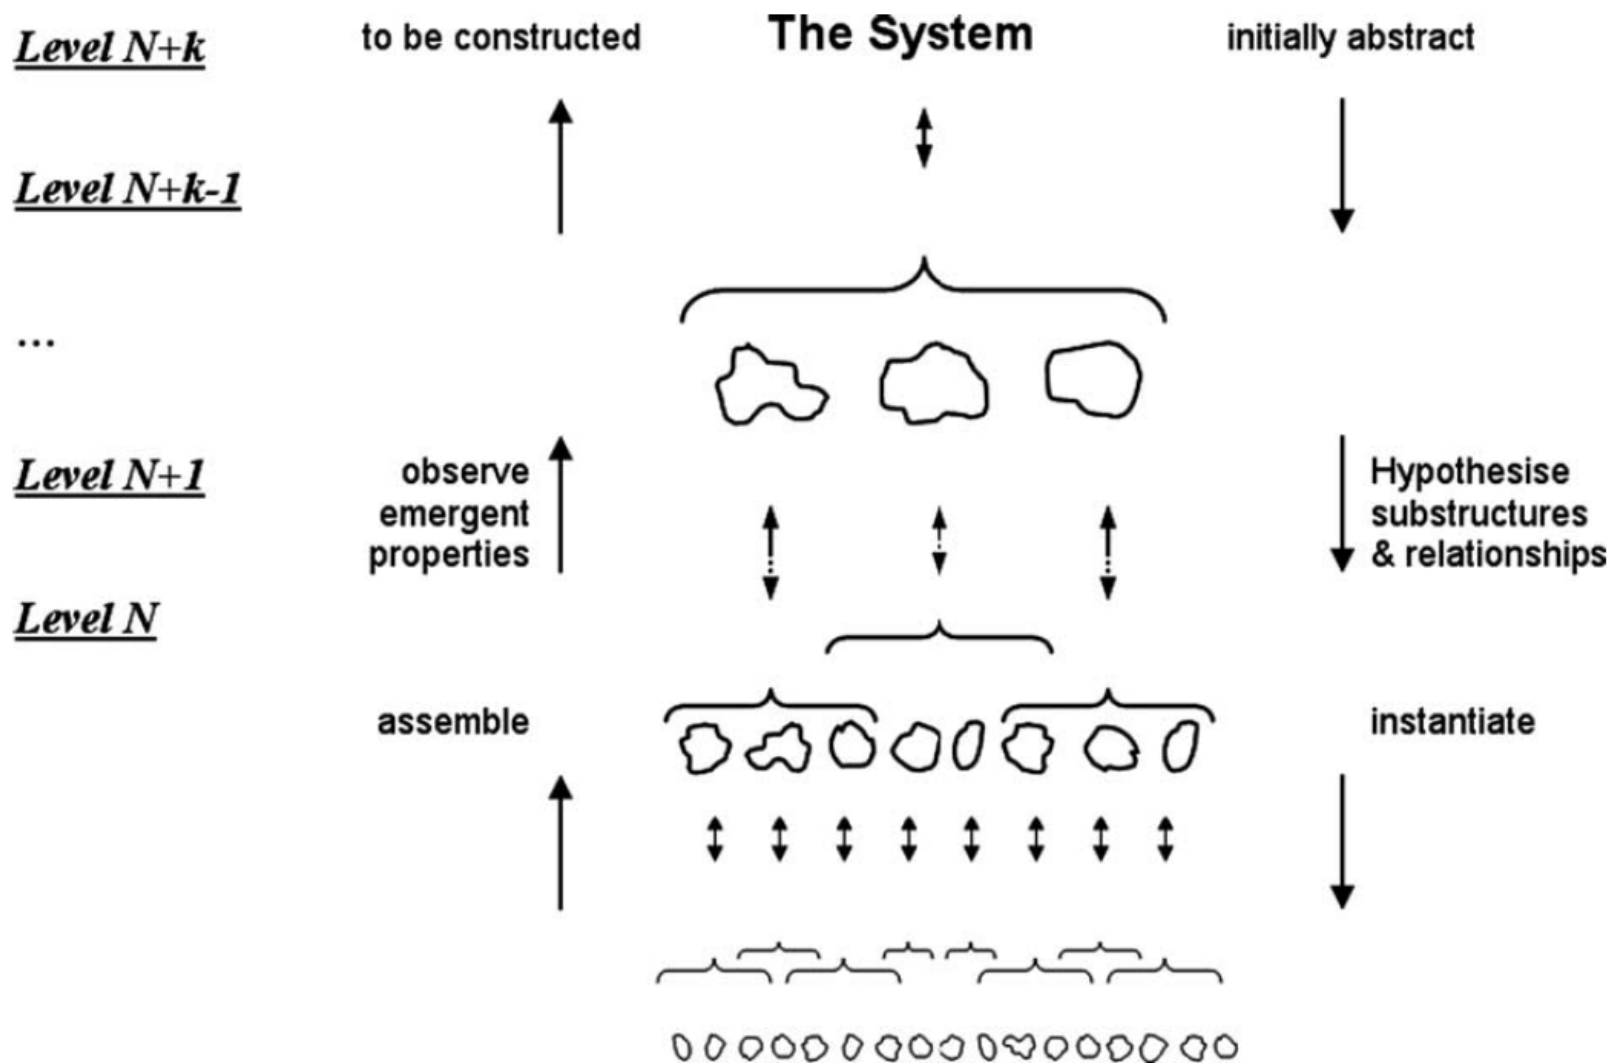

Fig 3. Design as bottom-up construction and top-down hypothesis, generation and reasoning.

Example: Innovation systems in China

Manufacturing has lower value than design, IP and marketing

Policy: move to the ends of the smiles for greater added value

Example: Innovation systems in China

Manufacturing has lower value than design, IP and marketing

Policy: move to the ends of the smiles for greater added value

Policy Question: what can the government do to improve innovation in China?

Example: Innovation systems in China

Policy Question: what can the government do to improve innovation in China?

necessary but *not sufficient* ingredients for successful industrial innovation:

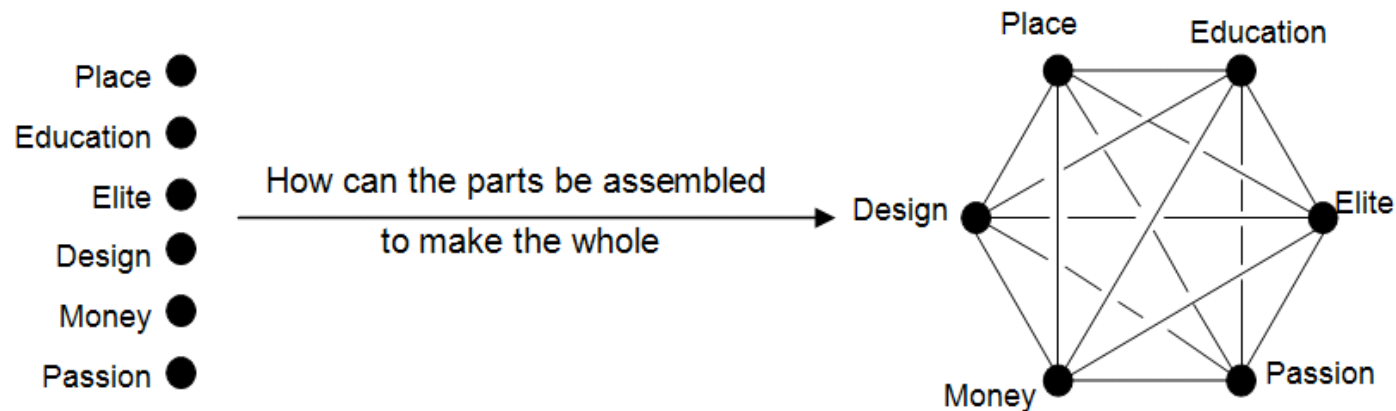

Place	location with diverse resources and capabilities, e.g. cities
Education	school system to develop ability, Advanced Education
Elite	with spare time to think (researchers, rich people)
Passion	hunger to do something different & desire to make money
Money	Money to invest in R&D
Design	Design and IP, Marketing

Example: Innovation systems in China

Policy Question: what can the government do to improve innovation in China?

necessary but *not sufficient* ingredients for successful industrial innovation:

Place	location with diverse resources and capabilities, e.g. cities
Education	school system to develop ability, Advanced Education
Elite	with spare time to think (researchers, rich people)
Passion	hunger to do something different & desire to make money
Money	Money to invest in R&D
Design	Design and IP, Marketing

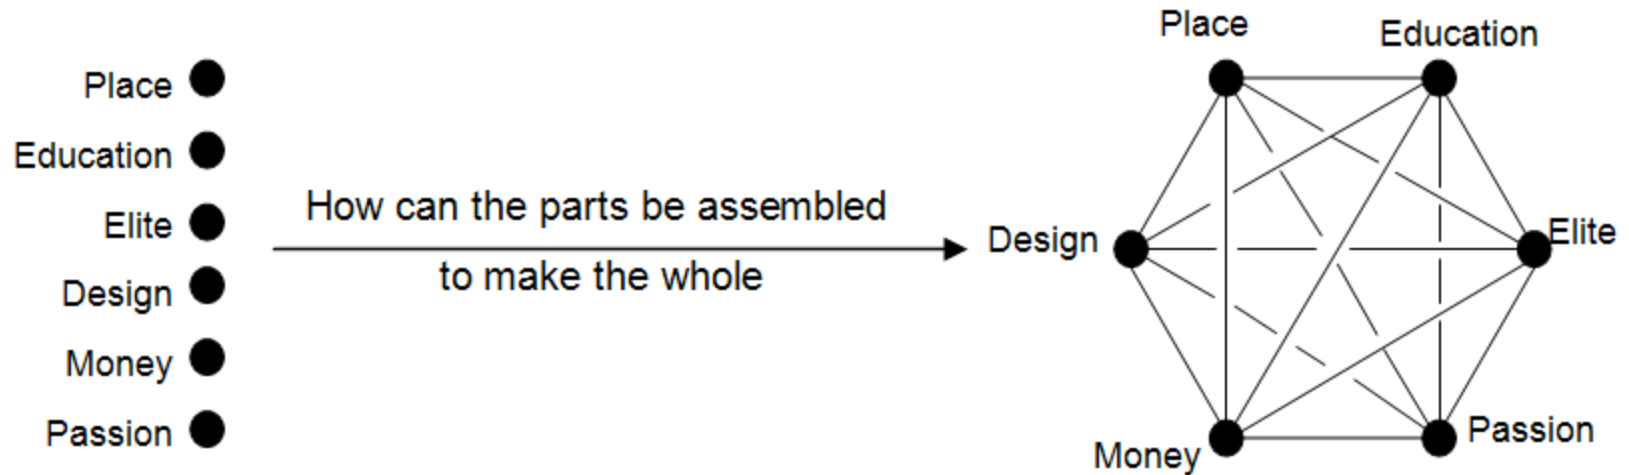

How can the vertices be assembled to form 5-dimensional hypersimplex

$\langle \text{place, education, elite, passion, money, design; } R_{\text{innovation}} \rangle$

Example: Innovation systems in China

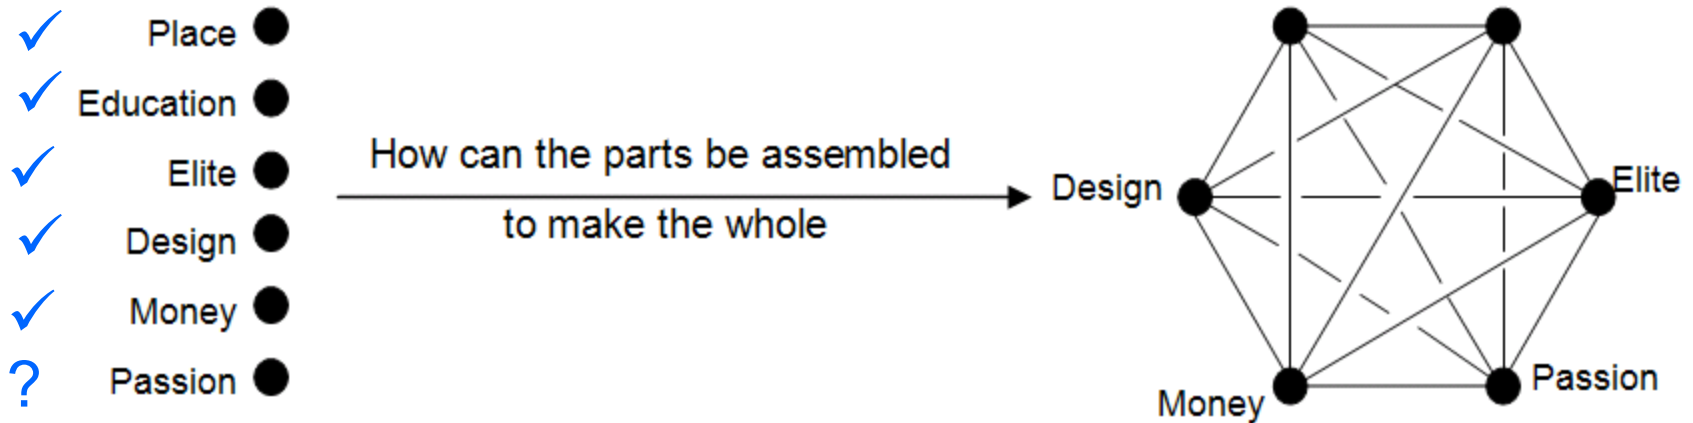

Policy Question: what can the government do to improve innovation in China?

Which vertices can the Government change?

Example: Innovation systems in China

Policy Question: what can the government do to improve innovation in China?

Which vertices can the Government change?

Are any vertices missing?

If the Government changes the vertices will the simplex form?

Example: Innovation systems in China

Policy Question: what can the government do to improve innovation in China?

This is a multilevel system of systems

Place World > China > Provinces > Cities > innovation clusters > ...

Education Universities > Teaching & Research x Types > ...

Elite academics, research fields – pure, applied > individuals > ...

Passion personality types, behaviours individuals

Money tax breaks, grants, ...

Design specialisms, patents by type, ...

Example: Innovation systems in China

Policy Question: what can the government do to improve innovation in China?

Scientific question: how can the Government know that policy might work?

predicting that an intervention kicks will result in a future target state

Example: Innovation systems in China

Policy Question: what can the government do to improve innovation in China?

Scientific question: how can the Government know that policy might work?

? Multilevel agent based simulations

e.g. micro-simulations at individual levels

Example: Innovation systems in China

Policy Question: what can the government do to improve innovation in China?

Detecting innovation in Big Data

Feature F_1 measured by number of new products sold

Feature F_2 trading patterns with other companies

Feature F_3 trading patterns with individuals

These patterns form relational simplices $\sigma_t = \langle F_1, F_2, F_3; R_t \rangle$

Then may have ‘innovation hypersimplices’ through time: $\langle \sigma_1, \sigma_2, \sigma_3, \sigma_4, \dots; R \rangle$

Example: Innovation systems in China

Figure 2. discrete micro-dynamic, semi-continuous meso-dynamics and continuous macro-dynamic

System dynamics as traffic on an evolving multilevel backcloth

Conclusions: Hypernetworks & Design in Global Systems Science

The 21st century coordination problem: Global Challenges spreading on global webs

Climate change impact, pandemics, financial instability, energy sufficiency, urbanisation

All these challenges ~~spread on global webs~~ and create interdependencies across these global webs: 'systems of systems'.

— **Multilevel Hypernetworks**

Coordination across global webs of different interests, cultures, economic interests becomes a main policy challenge:

— **Policy Design**

☒ ☒ Unintended consequences of actions

☒ ☒ Systemic risk (see financial crisis 2008)

In such 'system of systems', societies tends to address subsystems (countries, policy sectors....) and so fail to achieve systemic lasting change.

Policies need to be made coherent across webs of influence: Need for Systems approaches.

Ralph Dum:

Conclusions: Hypernetworks & Design in Global Systems Science

Global Systems Science as a 3-simplex

Conclusions: Hypernetworks & Design in Global Systems Science

Policy
Science
Design

Conclusions: Hypernetworks & Design in Global Systems Science

- Hypernetworks augment standard network approaches to include relations between many things
- Hypernetworks give a natural way of representing multilevel structure and systems of systems of systems
- Design is the construction of new multilevel systems
- Policy is designing the future
- Science, policy and design are inextricably entangled
- GSS, policy, design & hypernetworks are inextricably entangled
